Lachaise F., Somme G., Carpentier G., Granjeon E., Webster S.,
Baghdassarian D.,
A transabldolase. An enzyme implicated in crab steroidogenesis.";
Endocrine 5:23-23(1996).
-!- FUNCTION: Actins are highly conserved proteins that are involved in various types of cell motility and are ubiquitously expressed in all eukaryotic cells.
-!- SUBCELLUIAR LOCATION: Cytoplasmic.
-!- SUBCELLUIAR LOCATION: Cytoplasmic.
-!- MISCELLARGOUS. ON THE 2D-GEL THE DETERMINED PI OF THIS PROTEIN IS:
                                                                                                                                                                                 Sex pheromone CAD1.
Enterococcus faecalis (Streptococcus faecalis).
Bacteria, Pirmicutes; Lactobacillales; Enterococcaceae; Enterococcus.
                                                                                                                                                                                                                                                                               MEDLINE-85051889; PubMed-6437872; MEDLINE-85051889; PubMed-6437872; MEDLINE-85051889; PubMed-6437872; Mori M., Sagakami Y., Narita M., Isogai A., Fujino M., Kitada C., Craig R.A., Clewell D.B., Suruki A.; "Isolation and structure of the bacterial sex pheromone, cAD1, that induces plasmid transfer in Streptococcus faecalis."; FEBS Lett. 178:97-100(1984).
-!- FUNCTION: CAD1 IS INVOLVED IN THE CONJUGATIVE TRANSFER OF THE HEMOLYSIN PLASMID PAD1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Carcinus maenas (Common shore crab) (Green crab).

"AFI, a sequenced bioactive neuropeptide isolated from the nematode
Ascaris suum.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cells.
--- TISSUE SPECIFICITY: Found in the nerve cords and a variety of ganglia particularly in the anterior regions.
---- SIMILARITY: Belongs to the FARP (FWRFamide related peptide)
                                                                                             TISSUE-Venom;

unblocking with N-acylaminoacyl-peptide hydrolase.";
Anal. Biochem. 199:45-50(1991).
-!- FUNCTION: This enzyme catalyses the hydrolysis of the N-terminal peptide bond of an N-acetylated peptide to generate an N-acetylated amino acid and a peptide with a free N-terminus. It preferentially cleaves off Ac-Ala, Ac-Met and Ac-Ser.
-!- CATALYTIC ACTIVITY: Acylaminoacyl-peptide + H(2)O = acylamino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sex pheromone CCF10.

WPI; 2001-442248/47.

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues.

Claim 49; Page 32; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VRGPD (vascular endothalial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabet carbon separation distances on opposite antiparallel strands of a

```
cyclising the peptide by oxidising the cysteine residues. The monocyclic cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, newsacularisation or lymphangiogenesis in meawal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, archeologian, vascularised malignant or benigh tumour, post-recovery cerebrovascular accident, post-engloplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive corrected angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability cor in a mammal (the mammal has a condition characterized by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic or brain, inflammation, with an anti-inflammatory agent, to treat a conditional activity induced by VBGF. Or -D and care also used in combination with an anti-inflammatory agent, to treat a distance of inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

to cyclisation are used to interfere with angiogenesis,
covacularisation or lymphangiogenesis in a mammal with a condition
characterised by angiogenesis, neovascularisation or lymphangiogenesis.

Characterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriansis, arthropathy,
cerebrovascular accident, post-angioplasty restenosis, head, heat or cold
confines. The peptides are also used to modulare vascular permeability
in a mammal (the mammal has a condition characterised by fluid
accumulation in peripheral limbs or in lungs, peritomeal cavity, pleura,
cor brain. The peptides are used to image blood vessels and lymphatic
cor brain. The peptides are used to image blood vessels and lymphatic
with at least one biological activity induced by VEGF- or -D and
care also used in combination with an anti-inflammatory agent, to treat a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                  The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endochelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .<del>.</del>

  peptide loop fragment from an exposed loop of a growth factor protein and peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides dimeric bicyclic peptides (comprising 1 linked monocyclic peptides) and a cyclic peptides (comprising 1 linked monocyclic peptides) and a cyclic peptides with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, a condition characterised by angiogenesis, in mechasila with a condition characterised by angiogenesis, inecessis, arthropathy, recondition is diabetic retinopathy, psoriasis, arthropathy, recondition is diabetic retinopathy, psoriasis, head, head or cold trauma, substance-induced neconscular part research in the condition induced neconscular sequelae, or chronic liver sequelae, hypertension induced neconscular sequelae, or chronic liver in farmmal than a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to induse blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. VGF-C or D and care also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human CC whose 3-dimensional structure is modelled on the expose loop of human CC WGZPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betacce contains the peptide a monomeric monocyclic peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides loop factoric peptides with at least one residues. The monocyclic peptides and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis.

CC peptides and a cyclic peptide with a least one linked monocyclic peptides in a mammal with a condition are used to interfere with anglogenesis.

CC characterised by anglogenesis, neovascularisation or lymphanglogenesis.

CC characterised by anglogenesis, neovascularisation or lymphanglogenesis.

CC characterised by anglogenesis, neovascularisation of the liver, excessive createmer anglosenesis, neovascularisation of the liver, excessive corporation. The peptides are also used to modulate vascular permeability in fifection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, con brain. The peptides are used to inage hold vessels and lymphatic and contains are used to in a mammal of the interference.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. VEGF. or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human by WegFP (vescular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a mesauring betabet a carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, neovascularisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, peoritasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold tramms collent period and analysis of the condition of the liver, excessive tramms, substance of mevascularisation of the liver, excessive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  hormone related angiogenic dysfunction, diabetes induced neovascular sequelae, bypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modilate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by WEGF. VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthitis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Gaps

The peptide is conformationally constrained by groups attached to each side. The peptide mimics a beta turn and can bind to at least one HIV envelope protein, thus inhibiting infection. It inhibits the interaction between HIV envelope glycoproteins and human cell-surface protein CD4 by mimicking structures of CD4. See also AAR24950-R24959 and AAR25122.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a target antigenic peptide derived from the CDR2-like domain of the human CD4 protein. The peptide is cyclised by the addition of cystein eresidues at either end. The specification of cascribes antigenic peptides derived from the CDR2-like domain of CD4 (amino acids 27-66 of AAY54500). These antigenic peptides present cutralising receptor/Co-receptor effectors sites of the CDR2-like domain. The peptides evoke effective antibody responses by having optimised sitespecificity. The induced antibodies block human immune deficiency virus specificity. The induced antibodies block human immune deficiency virus corrections with other cells, deliver signals to T cells (inhibiting normal CD4+mediated immunoregulatory functions) or induce apoptosis of corrections with other cells, deliver signals to T cells (inhibiting normal CD4 cells by simultaneous engagement of T cell receptors. Conjugates and peptides containing the antigenic peptides are used for active immunisation to generate antibodies against CD4 surface complexes, especially to prevent binding of HIV to CD4 and thus HIV infection, but also to treat undesirable immune responses such as transplant rejection, or autoimmune diseases (theumatodia arthritis, systemic lupus autoimmune diseases (theumatodia arthritis, systemic lupus antibodies which are broadly neutralising against primary isolates from all lasses of HIV-1 and of HIV-2. The peptides may include a promiscuous T helper epitope that is active in genetically diverse subjects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The present invention relates to polypeptides that bind cellular receptors for vascular endothelial growth factors (VEGFs), the polynectostides encoding them, and their use for identifying agents that colymucleotides encoding them, and their receptors. VEGFs and their modulate interactions between VEGFs and their receptors VEGFs and their receptors play an important role in vasculogenesis, the development of the embryonic vasculations from early differentiating endothelial cells and angiogenesis, the process of forming new blood vessels from precentising ones. Modulators of interactions between VEGF and its receptors existing ones. Modulators of interactions between VEGF and its receptors of spaces. Such disorders include cancers, abnormal angiogenesis, proliferative retinopathies, age-related macular degeneration, rheumatoid arthritis and psoriasis. The polypeptides of the invention exhibit unique receptor binding profiles compared to known naturally occurring VEGFs.

ANUGH446-AAUGH445 represent the peptides Al-A9 which are encoded by human VEGF-A forward primers used in the methods of the present invention
                                                                                                                         Human; vascular endothelial growth factor; VEGF-A; vasculogenesis; angiogenesis; blood vessel; cancer; proliferative retinopathy; psoriasis; age-related macular degeneration; rheumatoid arthritis; cardiovascular;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polypeptides that bind cellular receptors for vascular endothelial growth factors, polynucleotides encoding them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Protein polymeric adhesion substrate glutamine donor peptide #15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 26; DB 4; Length 8; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence is an immunogenic fragment of feline immunodeficiency virus (FIV) glycoprotein 130. Peptides AAY57038-Y57039 (also fragments of gp130) are used in the invention as capture polypeptides when diagnosing FIV infection. The invention relates to an antibody binding composition which consists of an enhanced capture polypeptide, which contains an immunogenic fragment of FIV gap precursor p55, and a second fragment which is part of the env precursor gp130, and an antibody-binding detection composition. The invention also includes a device for performing an assay which determines whether a feline is infected with Immunodeficiency Virus infection

This is an example of a glutamine donor peptide that can be utilised in novel recombinant protein polymers of the invention. Such polymers (see AAM4910-28) typically comprise a repetitive amino acid backbone of repetitive units having a collagen, fibroin, elastin or keratin motif and at least 2 enzyme recognition sequences comprising a glutamine and/or lysine capable of enzyme catalysed isopetide formation. The polymers are capable of covalent crosslinking by enzymatic reaction to form products which set quickly and have good adhesive properties and high strength. They can be used as medical adhesives and sealants, in the closure of wounds and repair of damaged tissues, prosthesis coatings, drug depots, and matrices for the transplantation of cells. (Updated on 25-WAR-2003 to correct PF field.)
                                                                                       New recombinant protein polymers - containing naturally occurring repetitive units for crosslinking by enzymes, useful as medical adhesives and sealants, depots and matrices.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptides which selectively home to organs or tissues, used for, e.g. identifying target ligands and for therapy of pathological conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homing peptide; organ; tissue; lung; pancreas; skin; retina; MDP; prostate; ovary; lymph node; adrenal gland; liver; gut; tumour; membrane dipeptidase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The peptides AAR80351-70 are examples of glutamine donor peptides which can be used to generate protein polymeric adhesion substrate (PPAS) contay repeats of non-fibrin cross-linking donor peptide sequences (see AAR80345-50 for examples of PPAS proteins). The PPAS proteins can be used as substrates in enzymatic cross-linking reactions catalysed by a transglutaminase enzyme e.g. Factor VIII or XIII. The polymers can be used in biological systems where in situ formation of a biocompatible material with structural integrity is required e.g. as medical adhesives and sealants or for wound closure or tissue repair
              Pendent group, repeating unit, enzyme recognition site; sealant, fibrin, enzymatic cross-linking; biocompatible material, structural integrity; medical adhesive; wound closure; tissue repair; transglutaminase;
                                                                                                                                                                                                                                                                                                                                                                                                                              Protein polymers comprising repeating units and sequences - capable of enzyme-catalysed covalent bond formation useful as a biocompatible material for wound closure and tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protein polymer; adhesive sealant; wound healing; cross-linking.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

This invention relates to a novel method for identifying disease targeting peptides. The method comprises exposing a sample from an organ, tissue or cell type of interest, to a phage display library and recovering phage bound to the sample (the phage expresses targeting peptides). The peptides identified by the method of the invention may have cytostatic, immunosuppressive, anti-inflammatory, antiathritic, antiatherosclerotic, antidiabetic, antibaterial and antiviral activities. The methods and composition are useful for identifying targeting peptides and one or more receptors for a targeting peptide. The targeting peptides are used for selective delivery of therapeutic agents, including gene therapy vectors and fusion proteins, to specific organs, tissues, or cell types in subject. The targeting peptide may also be used
                                                                                                                                                                                                                                                                           .;
0
              tissue or organ. The peptides can be used for identifying an organ or tissue or for treating an target molecule expressed by an organ or tissue or for treating an organ or tissue pathology, where the organ or tissue is selected from prostate, lung, skin, retina, pancreas, gut, ovary, adrenal gland, liver and lymph node. The peptide bind to the membrane dipeptidase (MDP). AAV48618 to AAV49066 represent sequences which are used in the exemplification of the present invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 14, Application US/09827345

Sequence 14, Application US/09827345

Publication No. US20030021800a1

GENERAL INFORMATION:

APPLICANT: GENERALN, JEAN-CLAUDE

APPLICANT: GALEA, PRSCALE

TITLE OF INVENTION: VACCINE AGAINST INFECTIOUS AGENTS HAVING AN

TITLE OF INVENTION: UNTRACELLULAR PHASE, COMPOSITION FOR THE TREATMENT AND

TITLE OF INVENTION: UNTRACELLULAR PHASE, COMPOSITION FOR THE TREATMENT AND

TITLE OF INVENTION: DIAGNOSIS

TITLE OF INVENTION: UNBERS: US/09/827,345

CURRENT APPLICATION NUMBER: US/09/827,345

CURRENT PAPLICATION NUMBER: 09/599,549

PRIOR FILING DATE: 2000-06-23

```
Eur. J. Biochem. 230:235-241(1995).
-!- FUNCTION: This protein is one of the nuclear-coded polypeptide
chains of cytochrome c oxidase, the terminal oxidase in
mitochondrial electron transport.
-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   STRAIN-Wistar; TISSUR-Liver;

-!- FUNCTION: May be involved in the regulation of photosystem II.
-!- FUNCTION: May be involved in the regulation of photosystem II.
-!- SUBCELLULAN LOCATION: Chloroplast thylakoid membrane; associated with the photosystem II complex (By similarity).
-!- MISCELLANEOUS: On the 2D-gel the determined pI of this protein (spot NI79) is: 5.9, its MW is: 22 kDa.
-!- SIMILARITY: Belongs to the pabp family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 FEBS Lett. 247:143-146(1989).
-!- FUNCTION: Depolymerization of lignin. Catalyzes the C(alpha)-
C(beta) cleavage of the propyl side chains of lignin.
-!- CATALYMIC ACTIVITY: 1,2-bis(3, 4-dimethoxyphenyl)propane-1,3-diol +
H(2)O(2) = veratraldehyde + 1-(3,4-dimethylphenyl)ethane-1,2-diol
                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              15-JUL-1999 (Rel. 38, Created)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptides 4:367-373(1983).

-!- FUNCTION: Urotensin is found in the teleost caudal neurosecretory system. It has a suggested role in osmoregulation and as a corticortrophin-releasing factor.

-!- SUBCELLULAR LOCATION: Secreted.

-!- SUBCELLULAR LOCATION: Secreted.

-!- SIMILARITY: Belongs to the urotensin 2 family.

venom of Conus marmoreus.";
J. Biol. Chem. 275:39516-39522 (2000).

-i. FUNCTION: Inhibits the neuronal noradrenaline transporter.
-i. SUBCELLULAR LOCATION: Secreted.
-i. TISSUE SPECIFICITY: Expressed by the venom duct.
-i. MASS SPECIFOMETRY: NW-1262.77; NW ERR=0.07; METHOD=Electrospray.
-i. MSAS SPECIFOMETRY: Ms-1262.77; NW ERR=0.07; METHOD=Electrospray.
-i. SIMILARITY: Belongs to the chi/lambda-conotoxin family.
                                                                                                                                                                                                                                                                                                        HYDROXYLATION.

"Callitachykinin I and II, two novel myotropic peptides isolated from the blowfly, Calliphora vomitoria, that have resemblances to tachykinins.";
Peptides 15:761-768(1994).
-!- FUNCTION: Myoactive peptide.
-!- SIDELELULAR LOCATION: Secreted.
-!- SIMILARITY: SOME SIMILARITY TO TACHYKININS.

Furtury K., Linds S., Reynolds S.E., Ota R.B., Hackett M., Schooley D.A., Schooley D.A., Isolation and identification of a cardioactive peptide from Tenebrio molitor and Spodoptera eridania.", Biol. Chem. Hoppe-Seyler 374:1065-1074(1993).

-i - FUNCTION: The effect of CQAP is both ino- and chronotropic.
-i - SURCELAULAR LOCATION: Secreted.
-i - TISSUE, SPECIFICITY: Stored in pericardial organs and released
